1st SEM. 2019/2020

UNIVERSITY OF ESWATINI

FINAL EXAMINATION PAPER

PROGRAMME: B.Sc. in Agricultural Economics and Agribusiness Management
Year 3

COURSE CODE: AEM307

TITLE OF PAPER: INTRODUCTION TO ECONOMETRICS

TIME ALLOWED: TWO (2) HOURS

INSTRUCTION: 1. ANSWER ALL QUESTIONS
2. EACH QUESTION CARRIES TWENTY FIVE (25) MARKS

DO NOT OPEN THIS PAPER UNTIL PERMISSION HAS BEEN GRANTED BY THE CHIEF INVIGILATOR

QUESTION 1

1. You have been commissioned to investigate the relationship between the birth weights of newborn females and the number of prenatal visits to a physician or midwife that their mothers made during pregnancy. The dependent variable is $bwght_i$, the birth weight of the i-th newborn female, measured in *grams*. The explanatory variable is $pnvisits_i$, the number of prenatal visits of the i-th newborn's mother during pregnancy, measured in number of visits. The model you propose to estimate is given by the population regression equation:

$$bwghti = \beta 0 + \beta_1 pnvisitsi + \mu$$

Your research assistant has used 857 sample observations on bwghti and pnvisitsi to estimate the following OLS sample regression equation, where the figures in parentheses below the coefficient estimates are the *estimated standard errors* of the coefficient estimates:

$$\underset{\text{(standard errors)}}{\underset{}{\widehat{bwght}_i = 3199.02 + 14.1219\,pnvisits_i} \quad \underset{}{(65.6909)\ \ (5.36347)}} + \hat{u}_i \qquad (i = 1, \ldots, N) \qquad N = 857$$

i. Interpret the estimated coefficient on pnvisits. **[3 Marks]**

ii. Perform a test of the null hypothesis H0: $\beta_1=0$ against the alternative hypothesis H1: $\beta_1\neq0$ at the 1% significance level (i.e., for significance level $\alpha = 0.01$). Show how you calculated the test statistic. State the decision rule you use, and the inference you would draw from the test. What would you conclude from the results of the test? **[8 MARKS]**

iii. Compute the two-sided 95% confidence interval for the intercept coefficient β_0. Use this two-sided 95% confidence interval for β_0 to test the hypothesis that the mean birth weight of newborn females whose mothers made no prenatal visits to a physician or midwife equals 3,000 grams. State the null hypothesis H0 and the alternative hypothesis H1. State the decision rule you use, and the inference you would draw from the test. **[7 MARKS]**

iv. Perform a test of the proposition that each additional prenatal visit made by the mother is associated on average with an increase in their newborn females' birth weight of less than 25 grams. Use the 5 percent significance level (i.e., $\alpha = 0.05$). State the null hypothesis H0 and the alternative hypothesis H1. Show how you calculated the test statistic. State the decision rule you use, and the inference you would draw from the test. **[7 MARKS]**

QUESTION 2

i. Discuss the types of data that are used in economic analysis. What are their key characteristics and differences? (You can use example tables while answering this question). **[8 MARKS]**

ii. What does R-squared measure? How is it calculated and interpreted? **[6 MARKS]**

iii. Discuss Causality. What is the causal relationship and how is it different from correlation? **[5 MARKS]**

iv. What are dummy variables? Discuss briefly the features of the dummy variable regression model. **[6 MARKS]**

QUESTION 3

Consider the earnings model: $Wagei = \beta 1 + \beta 2Experi + \beta 3Educi + ui$, Where Wage is measured in dollars per hour, $Exper$ is work experience in years, and $Educ$ is the number of years of schooling. The OLS regression results for $N = 100$ males in a given year is shown in Table 1 below:

Table 1. STATA results from OLS estimation of the earnings model

Source	SS	df	MS	Number of obs = 100
Model	2057.5037	2	1028.75185	F(2, 97) = 16.47
Residual	6059.71269	97	62.4712648	Prob > F = 0.0000
				R-squared = 0.2535
Total	8117.21639	99	81.9920847	Adj R-squared = 0.2381
				Root MSE = 7.9039

wage	Coef.	Std. Err.	t	P>|t|	[95% Conf.	Interval]
Educ	1.435782	.321546	4.47	0.000	.7976026	2.073962
Exper	.328525	.0658247	4.99	0.000	.1978813	.4591687
_cons	-11.91922	4.750254	-2.51	0.014	-21.34716	-2.491275

i. The researcher performed a correlation test and received the results presented in Table 2 below:

Table 2. Pairwise correlations

	grade	exper	wage
grade	1.0000		
exper	-0.3665	1.0000	
wage	0.2485	0.3163	1.0000

Use the results in Table 2 to discuss the severity of the multicollinearity and the likely impacts on the OLS results in Table 1. **[10 MARKS]**

ii. Using the results in Table 3 below.

Table 3. STATA results with squared OLS residuals as the dependent variable

```

```

Perform White's general test for heteroscedasticity. Be sure to carefully set up the null and alternative hypotheses and draw a conclusion. **[15 MARKS]**

QUESTION 4

i. Discuss models with Binary dependent variables. Explain interpretation of Beta in such a model. **[7 MARKS]**

ii. Discuss the procedure of the Durbin-Watson test and the Breush-Godfrey test for higher order serial correlation. **[11 MARKS]**

iii. Discuss the procedures of Breusch-Pagan test for heteroskedasticity. **[7 MARKS]**

Percentage Points of the t-Distribution

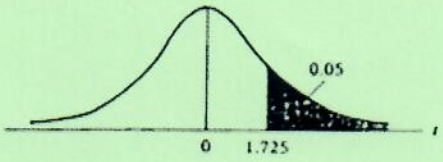
TABLE D.2
Percentage points of the *t* distribution

Example

$Pr(t > 2.086) = 0.025$

$Pr(t > 1.725) = 0.05$ for df = 20

$Pr(|t| > 1.725) = 0.10$



df \ Pr	0.25 0.50	0.10 0.20	0.05 0.10	0.025 0.05	0.01 0.02	0.005 0.010	0.001 0.002
