

1

UNIVERSITY OF ESWATINI
DEPARTMENT OF CHEMISTRY

MAIN EXAMINATION 2020/2021

TITLE OF PAPER: RESEARCH METHODS IN CHEMISTRY

COURSE NUMBER: CHE 604

TIME ALLOWED: THREE (3) HOURS

INSTRUCTIONS: ANSWER ANY FOUR (4) QUESTIONS

Special Requirements

1. Data sheet.
2. Graph Paper

YOU ARE NOT SUPPOSED TO OPEN THIS PAPER UNTIL PERMISSION TO DO SO HAS BEEN GIVEN BY THE CHIEF INVIGILATOR.

QUESTION 1 [25]

(a) Briefly discuss the technique “Analysis of Variance” and why would such a research method be useful in data analysis (6)

(b) (i) Use a diagram to explain what is meant by aliasing? (3)

(ii) Apply the Nyquist Theorem to explain how aliasing can be avoided. (3)

(c) The following data was obtained during a spectrophotometric determination of Fe in tap water samples following complexation with bipyridine:

Triplicate absorbance readings for the standards: **1.16 ppm** – 0.120, 0.125, 0.130 ; **2.32 ppm** – 0.248, 0.255, 0.252;
3.48 ppm – 0.382, 0.385, 0.384 ; **4.65 ppm** – 0.504, 0.506, 0.502

Triplicate absorbance readings for the sample are: **0.337, 0.335, 0.340**

(i) Calculate the equation of the calibration curve using the Least Squares Method (5)

(ii) Calculate the absolute error associated with the calibration curve, S_{vc} (3)

(iii) Calculate the absolute error associated with the analytical measurement, S_a (3)

(iv) Calculate the absolute subsampling uncertainty, S_{ss} , in ppm units if five 500-mg portions of the sample were found to contain 3.08ppm, 3.07ppm, 3.11 ppm, 5.01 ppm, and 3.09 ppm. (2)

QUESTION 2 [25]

(a) (i) Explain the difference between “homogeneous” and “heterogeneous” samples. (3)

(ii) Discuss the challenges associated with the latter with respect to the sampling step in chemical analysis. (4)

(b) What is meant by a “reference method” in the analytical chemistry laboratory? (2)

(c) A new GC-MS method for the analysis of DDT in tissue samples is being evaluated by comparing the results obtained using it with that of the reference method based on HPLC. The results of the concentrations of DDT (in ppb), by the two methods are as shown in the table below:

Method	DDT concentration, ppb							
HPLC Reference	2.16	2.42	2.16	2.35	2.31	2.43		
New GC-MS	2.15	2.23	2.15	2.13	3.01	2.46	2.21	2.36 2.31

(i) Would you consider the value “3.01” in the data obtained by the new GC-MS method an “outlier” (3)

(ii) Is there a significant difference between the two methods at the 95% confidence level. (5)

(iii) Comment on the precision of the new GC-MS method relative to the reference one at 95% confidence level. (3)

(d) In chemical research, the encoding and decoding of analytical information affects the accuracy and precision of research data. Use diagrams to explain how the Si-VIDICON image sensor works in decoding analytical information. (5)

QUESTION 3 [25]

(a) (i) Write down the equation that describes the "normal curve of error" in chemometrics, and explain all terms appearing in it. (4)

(ii) Under what conditions in analytical sampling will the sample variance be the same as the population variance (2)

(b) The following absorbance data was obtained in triplicate during a standard additions determination of zinc in a river sediment sample using atomic absorption, AA, following classical dissolution of 500-mg portions:

Addition 0: 0.102
Addition 1: 0.149
Addition 2: 0.205
Addition 3: 0.246

where 0 μ L, 5 μ L, 10 μ L, and 15 μ L of a 100 ppm Zn standard solution was added to 10-mL aliquots of sample, respectively.

Thirty six (36) samples of river sediment were taken from a river to map the spatial variability of zinc. 500-mg portions of each sample were digested and zinc measured by AA following the standard additions procedure on the same day. The spatial distribution of zinc was found to be as follows:

(i) Identify the hotspot and coldspot in this population (3)

(ii) Use the Kolmogorov-Smirnov test to show that the distribution of zinc in the field is not Gaussian. (7)

- (iii) Calculate the uncertainty due to the sampling operation in ppm units, if five (5) portions of certified reference material gave the following results: 5.22 5.21 5.35 5.20 5.23 (4)
- (iv) Use the Student's t-test equation to determine the minimum number of samples to be taken from the population if the average value of zinc is to be within the error due to sampling at the 95% confidence level. (4)

QUESTION 4 [25]

- (a) In data acquisition, noise is an important concept in instrumental analysis as it is a predominant factor in determining precision and detection limits.
- Explain what is meant by "signal" in analytical data acquisition? (2)
 - Explain what is meant by "noise" in analytical data acquisition? (2)
 - Define "signal-to-noise ratio" in analytical data acquisition? (2)
 - Give the operational definition of "detection limit". (3)
- (b) What is the difference between "White Noise" and "Fundamental Noise" in analytical instrumentation. (3)
- (c) In regard to Johnson Noise,
- Explain its origins in analytical instrumentation (3)
 - Write down the equation relating the magnitude of this noise to the bandwidth, and explain all terms appearing in it (3)
- (d) In regard to Shot Noise,
- Explain its origins in analytical instrumentation (3)
 - Write down the equation relating the magnitude of this noise to the bandwidth, and explain all terms appearing in it (4)

QUESTION 5 [25]

- (a) (i) What is meant by a "certified reference material" in the analytical laboratory? (2)
- (ii) Explain how this material would be used to evaluate validity and reliability of copper measurements in sugar cane leaves. (3)
- (b) Blind samples are useful in analytical quality control in a commercial water laboratory.
- What is meant by a blind sample? (2)
 - Explain how blind samples are used to evaluate validity and reliability of Hg measurements in water. (3)
- (c) Quality control charts are useful in ensuring that repetitive day to day measurements are under statistical control. An in-house reference material was used to generate the following data over a period of 10 days of measurement of DDT in a tissue sample:

Day #	1	2	3	4	5	6	7	8	9	10
DDT, ppb	10	11	10	9	21	10	11	5	4	10

- (i) What is meant by an “in-house reference material”? (3)
- (ii) Draw the quality control chart for the DDT determination, assuming that the in-house reference material is 10 ± 2 ppb DDT. Which days were the measurements not under statistical control and why? (6)
- (d) Interlaboratory comparisons are useful in the evaluation of reliability and validity of analytical data. In the measurement of nitrates in a mine pit water sample by ion chromatography, “LAB A” ran ten replicate measurements on the sample, and requested “LAB B” to do the same with the remainder of the sample. The following results were obtained:

LAB A (ppm)	25	23	21	24	25	22	20	22	21	20
LAB B (ppm)	23	29	22	18	15	21	25	29	32	21

- (i) Comment on the validity of the results at the 95% confidence level (3)
- (ii) Comment on the relative precisions of the two laboratories at the 95% confidence level (3)

QUESTION 6 [25]

- (a) In the analysis of Cu in agricultural soils by flame atomic absorption spectrophotometry, describe three (3) sources of error in the analytical results. (6)
- (b) Use equations to explain the Benedetti-Pichler approach to sampling of solid samples. What are the short comings of this approach? (4)
- (c) River sediments present a challenge in their sampling for elemental analysis. What are these challenges, and how are they practically met? (4)
- (d) Describe Gy’s approach to sampling heterogeneous populations (4)
- (e) Describe Visman’s approach to sampling coal in a moving belt. (4)
- (f) Although amplification does not eliminate noise, amplifiers are useful in analytical data acquisition. For the integrator operational amplifier, draw the circuit and describe the output using the relevant equation. (3)

Statistical tables

The following tables are presented for the convenience of the reader, and for use with the simple statistical tests, examples and exercises in this book. They are presented in a format that is compatible with the needs of analytical chemists: the significance level $P = 0.05$ has been used in most cases, and it has been assumed that the number of measurements available is fairly small. Most of these abbreviated tables have been taken, with permission, from *Elementary Statistics Tables* by Henry R. Neave, published by Routledge (Tables A.2-A.4, A.7, A.8, A.11-A.14). The reader requiring statistical data corresponding to significance levels and/or numbers of measurements not covered in the tables is referred to these sources.

The critical values of t are appropriate for a two-tailed test. For a one-tailed test the value is taken from the column for twice the desired P -value, e.g. for a one-tailed test, $P = 0.05$, 5 degrees of freedom, the critical value is read from the $P = 0.10$ column and is equal to 2.02.

Table A.3 Critical values of F for a one-tailed test ($P = 0.05$)
