TITLE OF PAPER

ELECTRICITY & MAGNETISM

**COURSE NUMBER** 

P221

TIME ALLOWED

THREE HOURS

INSTRUCTIONS

ANSWER ANY FOUR OUT OF

SIX QUESTIONS

**EACH QUESTION CARRIES 25** 

**MARKS** 

MARKS FOR DIFFERENT

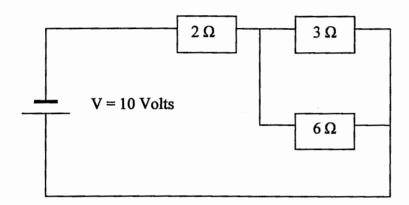

SECTIONS OF EACH QUESTION

ARE SHOWN IN THE RIGHT-HAND MARGIN

THIS PAPER HAS 8 PAGES, INCLUDING THIS PAGE

DO NOT OPEN THE PAPER UNTIL PERMISSION HAS BEEN GIVEN BY THE INVIGILATOR

a) Describe the physical content of Kirchhoff's current law and
 Kirchoff's voltage law.

b) In the circuit drawn above, the battery provides a steady voltage of 10 volts. The values of the resistances are given in the figure in Ohms.

What is the current that flows through each resistance?

[6]

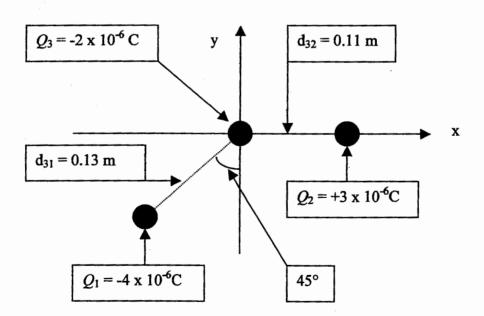

What is the potential drop across each resistance?

[6]

- c) A battery has an internal resistance. Describe an experiment that would enable you to
  - a) evaluate the magnitude of the internal resistance
  - b) determine the emf of the battery

[7]

- a) Consider a positive point charge of magnitude  $Q_1$ . What is the magnitude and direction of the electric field produced by this charge at a distance r from the charge expressed in S.I. units? [2]
- b) What is the force that acts between two point charges of magnitudes  $Q_1$  and  $Q_2$ ?
- c) What is the principle of superposition? [3]
- d) From the figure, determine the magnitude of the resultant force acting on  $Q_3$  produced by charges  $Q_1$  and  $Q_2$ . The three point charges are represented by black circles.  $d_{32}$  is the distance between point charges  $Q_3$  and  $Q_2$ , and  $d_{31}$  is the distance between charges  $Q_3$  and  $Q_1$ . The line connecting  $Q_1$  and  $Q_3$  is inclined at 45° to the horizontal and vertical axes.
  - e) What angle does the resultant force make with the horizontal axis? [6]

Write down an expression for the Lorentz force that acts on a point charge Q which is moving in a region of space where both the electric field E and magnetic fux density B are non-zero. [3]

- a) Describe how a charged particle with a well-defined velocity can be selected from a beam of similar particles which have a range of velocities. [12]
- b) A proton is in a uniform magnetic field of 0.1 tesla, which is perpendicular to the velocity of the proton. The proton moves in a circular orbit of radius 0.25 m. Calculate the orbital speed of the proton. [5]
- c) If the proton were to be replaced by an electron moving with the same velocity as the proton, what would the radius of the orbit of the electron be? [5]

- a) Write down an expression for Ampère's circuital law, and hence determine the magnitude of the magnetic field H at a distance a from a very long, straight wire carrying current I. The wire is parallel to the z-direction.

  [6]
- b) The conducting wire carries a conventional current that flows in the positive z-direction. Draw a diagram showing the long, straight wire and the direction and orientation, with respect to the wire, of lines of H. [6]
- c) 2 long, straight wires, both parallel to the z-direction, carry a conventional current in the positive z-direction. Is there a force between them, and, if it exists, is it attractive or repulsive? [6]
- d) The direction of the conventional current is reversed in one of the wires, but its magnitude is kept the same. Explain all the differences that this change in direction of current causes. [7]

- a) A circuit contains a resistor, an inductor and a capacitor connected in series to an alternating voltage supply. What is the impedance of this circuit? Explain carefully the meaning of each of the symbols you have used in your expression for the impedance. [7]
- b) For a certain angular frequency, the current is in phase with the alternating voltage. What is this frequency called: what is its magnitude, and why are the voltage and current in phase?

  [12]
- c) The quality factor,  $Q = \sqrt{\frac{L}{C}} \frac{1}{R}$ . Explain the importance of Q when describing the response of the circuit to an alternating driving voltage.

[6]

What is a dielectric? What is the magnitude of the electrical conductivity of an ideal dielectric? [2]

A parallel-plate capacitor was constructed from two rectangular plates of aluminium, each of area A, separated by a distance d. A battery that provided 50V was used to charge the capacitor. After the capacitor was fully charged, the battery was disconnected from the capacitor, and a dielectric was inserted between the two aluminium plates, which completely filled the space between the aluminium plates. What changes were caused by the insertion of the dielectric?

The dimensions of the capacitor and dielectric were as follows:

 $A = 0.02 \text{ m}^2$  d = 0.025 mthickness of dielectric = 0.025 m relative permittivity of the dielectric = 4

### Calculate the following quantities

- (a) the capacitance before the dielectric slab was inserted [5](b) the charge on the plates of the capacitor before the dielectric was
- inserted [4]
  (c) the charge on the plates of the capacitor after the dielectric was inserted [2]
- (d) the potential difference between the plates, and the capacitance, when the dielectric was between the plates. [6]
