

# UNIVERSITY OF ESWATINI

**FIRST SEMESTER MAIN EXAMINATION PAPER, APRIL 2021**

**FACULTY OF SOCIAL SCIENCES**

**DEPARTMENT OF ECONOMICS**

**COURSE CODE: ECO 419**

**TITLE OF PAPER: ECONOMETRIC METHODS I**

**TIME ALLOWED: 2 HOURS**

---

**Instructions**

1. This paper consists of Section (A) and (B).
2. Section A is compulsory.
3. Answer any two questions from Section B.

**Special Requirements**

Scientific calculator

**Additional Material (s)**

1. Statistical Tables

*Candidates may complete the front cover of their answer book when instructed by the Chief Invigilator and sign their examination attendance cards but must NOT write anything else until the start of the examination period is announced.*

*No electronic devices capable of storing and retrieving text, including electronic dictionaries and any form of foreign material may be used while in the examination room.*

**DO NOT turn examination paper over until instructed to do so.**

## SECTION A

### **Question One (Compulsory) [40 Marks]**

1. (a) A researcher studying the movement in the value added by workers in the production process estimated the following two equations:-

$$\text{Model A: } Y_t = \beta_0 + \beta_1 t + u_t \quad (1)$$

$$\text{Model B: } Y_t = \alpha_0 + \alpha_1 t + \alpha_2 t^2 + u_t \quad (2)$$

Where:-

$Y$ = labour's share      and  $t$ = time.

Using annual data for the period 2003- 2018, the following results were obtained for the primary metal industry:-

$$\begin{aligned} \text{Model A: } \hat{Y}_t &= 0.4529 - 0.0041t \\ &\quad (-3.9608) \end{aligned}$$

$$R^2 = 0.5284 \quad d = 0.8252$$

$$\begin{aligned} \text{Model B: } \hat{Y}_t &= 0.4786 - 0.0127t + 0.0005t^2 \\ &\quad (-3.2724) \quad (2.7777) \end{aligned}$$

$$R^2 = 0.6629 \quad d = 1.82$$

Where the figures in parentheses are  $t$ -ratios.

(i) Based on the regression results, would you say there is autocorrelation or not? Explain your answer using the “Rule of Thumb”. [4]

(ii) Test for autocorrelation in both models using the DW- Test at the 5% level of significance. [15]

(iii) What is the cause for the autocorrelation, if any? [3]

(b) Discuss the benefits of using an error correction model. [8]

(c) Given the following function of a unit root series:-

$$Y_t = Y_{t-1} + \varepsilon_t$$

Show algebraically that the variance of a unit root increases with time. [10]

## SECTION B

**Answer any Two Questions (30 Marks Each)**

**Question Two (30 Marks)**

2. (a) Assume we have the following model:

$$y_t = \alpha + \beta x_t + u_t$$

Where the explanatory variable  $x_t$  is strictly exogenous, and the residual  $u_t$  is serially correlated.

- (i) Why is serial correlation often present in time series data? [5]
- (ii) Why is the presence of serial correlation in the residual a problem? [10]
- (b) With the aid of graphs, distinguish between stationary & non-stationary time series. [15]

**Question Three (30 Marks)**

3. (a) Consider the following extended Keynesian model of income determination:

$$C_t = \beta_1 + \beta_2 Y_t - \beta_3 T_t + u_{1t} \quad \text{- Consumption function}$$

$$I_t = \alpha_0 + \alpha_1 Y_{t-1} + u_{2t} \quad \text{- Investment function}$$

$$T_t = \gamma_0 + \gamma_1 Y_t + u_{3t} \quad \text{- Taxation function}$$

$$Y_t = C_t + I_t + G_t \quad \text{- Income identity}$$

Where-: = consumption expenditure  $Y$ = income

$I$ = investment  $T$ = taxes

$G$ = government expenditure  $u_1, u_2, \text{ and } u_3$ = stochastic disturbances

- (i) List the endogenous and the predetermined variables in the system [3]
- (ii) Using the order condition, check the identifiability of each of the equations in the system, and of the system as a whole. [10]

- (iii) What would happen to the identifiability of each of the equations in the system if  $r_t$ , the interest rate, assumed to be exogenous, were to appear on the right-hand-side of the investment function? [7]
- (b) Distinguish between VAR models and simultaneous equation models. [5]
- (c) What is the connection between cointegration and spurious regression? [5]

**Question Four (30 Marks)**

4. (a) Explain the difference between an autoregressive and a moving average process. [8]
- (b) Why are AR and MA processes referred to as *stationary processes*? [5]
- (c) A researcher estimated the following model for a hypothetical economy:

$$\begin{aligned} Y_t &= C_t + I_t + G_t \\ C_t &= \beta_1 + \beta_2 YD_{t-1} + \beta_3 M_t + u_{1t} \\ I_t &= \beta_4 + \beta_5 (Y_{t-1} - Y_{t-2}) + \beta_6 Z_{t-1} + u_{2t} \\ G_t &= \beta_7 + \beta_8 G_{t-1} + u_{3t} \end{aligned}$$

Where:-       $Y$ = gross national product       $C$ = personal consumption expenditure  
 $I$ = gross private domestic investment  
 $G$ = government expenditure plus net foreign investment  
 $YD$ = disposable income       $M$ = money supply at the beginning of the quarter  
 $Z$ = property income before taxes       $t$ = time  
 $u_1, u_2, \text{ and } u_3$ = stochastic disturbances

All variables are measured in first-difference form.

Using quarterly data from 2010- 2019, the author applied the least-squares method to each equation individually and obtained the following results:-

$$\begin{aligned}\widehat{C}_t &= 0.09 + 0.43YD_{t-1} + 0.23M_t & R^2 &= 0.23 \\ \widehat{I}_t &= 0.08 + 0.43(Y_{t-1} - Y_{t-2}) + 0.48Z_t & R^2 &= 0.40 \\ \widehat{G}_t &= 0.13 + 0.67G_{t-1} & R^2 &= 0.42\end{aligned}$$

How would you justify the use of the single-equation least-squares method in this case? [5]

- (i) Why are the  $R^2$  values rather low? [4]
- (d) How does Granger causality differ from other types of causality? [8]

**TABLE D.5A**
