

**UNIVERSITY OF SWAZILAND**

**FINAL EXAMINATION PAPER 2008**

**TITLE OF PAPER : LINEAR STATISTICAL METHODS**

**COURSE CODE : ST204**

**TIME ALLOWED : 2 (TWO) HOURS**

**REQUIREMENTS : STATISTICAL TABLES  
AND CALCULATOR**

**INSTRUCTIONS : ANSWER ANY 4 (FOUR) QUESTIONS.  
ALL QUESTIONS CARRY EQUAL MARKS.**

**THIS PAPER IS NOT TO BE OPENED UNTIL PERMISSION HAS BEEN  
GRANTED BY THE INVIGILATOR**

**QUESTION ONE.**

[ 7 + 10 + 4 + 4 marks ]

- 1.1 What is Simple Linear Regression Model? Discuss the main purposes of fitting this model.
- 1.2 Find the point estimators of two regression coefficients using Method of Least Squares.
- 1.3 State the sampling distributions of the two regression coefficients.
- 1.4 Discuss the importance of the normality assumption in regression model.

**QUESTION TWO.**

[ 2 + 2 + 3 + 1 + 3 + 5 + 5 + 4 marks ]

The following output was obtained from running the model,  $Y_i = \beta_1 + \beta_2 X_i + \varepsilon_i$  using SPSS:

**ANOVA**

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	35.980	1	35.980	18.091	.000
	Residual	55.687	28	1.989		
	Total	91.667	29			

**Coefficients**

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	17.502	1.280		13.677	.000
	x	.491	.115	.627	4.253	.000

- 2.1 State the fitted regression line.
- 2.2 State the null and alternative hypotheses for the F-test of the above ANOVA table.
- 2.3 Perform the F-test and clearly state the conclusion.
- 2.4 What is the estimated value of  $\sigma^2$ ?
- 2.5 Test  $\beta_1 = 0$  against  $\beta_1 \neq 0$  at  $\alpha = 0.05$ .
- 2.6 Test  $\beta_1 = 20$  against  $\beta_1 < 20$  at  $\alpha = 0.01$ .
- 2.7 Test  $\beta_2 = 1$  against  $\beta_2 \neq 1$  at  $\alpha = 0.05$ .
- 2.8 Compute coefficient of correlation,  $r$  and explain the nature and strength of the relationship between dependent and independent variables.

**QUESTION THREE.**

[ 8 + 2 + 1 + 2 + 3 + 3 + 3 + 3 marks ]

- 3.1 Define a two-factor ANOVA Model and state its important features.
- 3.2 Suppose there is only one case for each treatment. What would be the new form of the model defined in question 3.1? Explain.
- 3.3 An aircraft firm is considering three different alloys for use in the wing construction of a new airplane. Each alloy can be produced in four different thicknesses. Two test samples are constructed for each combination of alloy type and thickness, each of the 24 test samples is subjected to a laboratory device that severely flexes it until failure occurs. For each test sample, the number of flexes before failure is recorded and analyzed using SPSS. The following ANOVA table is a part of the output from that analysis:

**ANOVA TABLE**

Source of Variation	Sum of Squares	df	Mean Square	F
Between treatments	2808.50	11	255.32	9.17
Factor A	232.50	3	77.50	2.78
Factor B	421.00	2	210.50	7.56
A X B	2155.00	6	359.17	12.91
Within treatments	334.00	12	27.83	
Total	3142.50	23		

Answer the following questions:

- What are the treatments in this experiment? How many?
- Which one is the Factor A? Which one is the Factor B?
- Using 5% level of significance, examine whether the alloy thickness has an effect on durability.
- Using 1% level of significance, examine whether the alloy type has an effect on durability.
- Using 5% level of significance, examine whether the treatment has an effect on durability.
- Using 1% level of significance, examine whether durability is influenced by interactions between alloy thickness and alloy type.

**QUESTION FOUR.**

[ 10 + 4 + 7 + 4 marks ]

A business analyst believes that capital utilization (as measured by inventory turnover) has a direct effect on a company's earnings yield. To examine this belief, the analyst randomly surveyed 9 JSE listed companies and recorded the information as follows:

Inventory turnover	3	5	4	7	6	4	8	6	5
Earnings yield	10	12	8	13	15	10	16	13	10

- Fit the regression line,  $Y_i = \beta_1 + \beta_2 X_i$ .
- Interpret the estimated values of  $\beta_1$  and  $\beta_2$ .
- What earnings yield can a company expect to achieve if they have an inventory turnover of 6 next year?
- Estimate  $\sigma^2$  and construct a 99% confidence interval for  $\sigma^2$ .
- Compute the coefficient of determination and interpret the value.
- Test  $\beta_2 = 0$  against  $\beta_2 \neq 0$  at  $\alpha = 0.05$ . Explain your conclusion.

**QUESTION FIVE.**

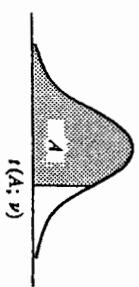

[ 8 + 17 marks ]

- 5.1 Discuss Regression Analysis and Analysis of Variance in terms of their similarities and differences.
- 5.2 An investor has consulted four different financial advisors (with ranging from very conservative, advisor A to very optimistic, advisor D) with regard to the expected annual rate of return for each of three portfolio possibilities she is considering. The advisor's respective estimates (in %) are as follows:

Advisor	Portfolio		
	1	2	3
A	8	8	5
B	12	10	8
C	8	11	10
D	15	12	11

- Identify the dependent variable, factor studied and factor levels.
- Complete the computation of the ANOVA table and conduct the F test. Clearly state all the steps in the test including the conclusion.
- What do you think about the consultation? Was it worth?

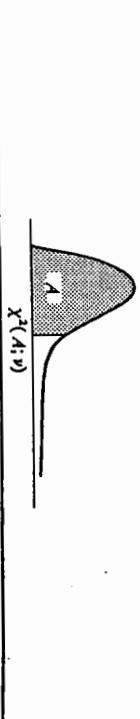

**TABLE A.2** Percentiles of the  $t$  Distribution  
Entry is  $t(A; \nu)$  where  $P\{t(\nu) \leq t(A; \nu)\} = A$

$\nu$	A						
	.60	.70	.80	.85	.90	.95
