

UNIVERSITY OF SWAZILAND

FINAL EXAMINATION PAPER 2009

TITLE OF PAPER : LINEAR STATISTICAL METHODS

COURSE CODE : ST204

TIME ALLOWED : 2 (TWO) HOURS

**REQUIREMENTS : STATISTICAL TABLES
AND CALCULATOR**

**INSTRUCTIONS : ANSWER ANY 4 (FOUR) QUESTIONS.
ALL QUESTIONS CARRY EQUAL MARKS.**

**THIS PAPER IS NOT TO BE OPENED UNTIL PERMISSION HAS BEEN
GRANTED BY THE INVIGILATOR**

QUESTION ONE.

[4 + 6 + 10 + 5 marks]

- 1.1 Define the Functional Relation and Statistical Relation between two variables.
- 1.2 Define Simple Linear Regression Model. Is it a Functional Relation model? Explain.
- 1.3 Find the point estimators of β_0 and β_1 using Method of Least Squares.
- 1.4 State the estimated (fitted) regression function and discuss the important properties of the Fitted Regression Line.

QUESTION TWO.

[2 + 2 + 2 + 4 + 1 + 5 + 4 marks]

A study is conducted with a group of dieters to see if the number of grams of fat each consumes per day is related to cholesterol level. The following output was obtained from running the model, $Y_i = \beta_0 + \beta_1 X_i + \varepsilon_i$ using SPSS:

ANOVA

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	2964.587	1	2964.587	3.407	.114
	Residual	5221.413	6	870.235		
	Total	8186.000	7			

Coefficients

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	Constant	110.115	59.108		1.863	.112
	x	12.784	6.926	.602	1.846	.114

- 2.1 Identify the dependent variable and independent variable.
- 2.2 State the fitted regression line.
- 2.3 What would be expected cholesterol level of a dieter who decides to consume 10 grams of fat every day?
- 2.4 Perform the F-test and clearly state the conclusion.
- 2.5 What is the estimated value of σ^2 ?
- 2.6 Test $\beta_1 = 15$ against $\beta_1 < 15$ at $\alpha = 0.01$.
- 2.7 Test $\beta_0 = 100$ against $\beta_0 \neq 100$ at $\alpha = 0.05$.
- 2.8 Compute coefficient of correlation, r and explain the nature and strength of the relationship between dependent and independent variables.

QUESTION THREE.

[4 + 6 + 3 + 10 + 2 marks]

- 3.1 Discuss the distinction between the *fixed effects models* and *random effects models* in single-factor studies.
- 3.2 State the *Cell Means Model* and *Factor Effects Model* for single factor studies and compare these two models.
- 3.3 A researcher wishes to see whether there is any difference in the weight gains of athletes following one of three special diets. Athletes are randomly assigned to three groups and placed on the diet for six weeks. The weight gains (in kg) are shown below:

Diet A	Diet B	Diet C
3	10	8
6	12	3
7	11	2
4	14	5
	8	
	6	

- a. Identify the dependent variable, factor studied and factor levels.
- b. Complete the computation of the ANOVA table and conduct the F test. Clearly state all the steps in the test including the conclusion.
- c. Which diet would you prefer for the athletes? Explain.

QUESTION FOUR.

[6 + 6 + 2 + 6 + 5 marks]

- 4.1 We have two descriptive measures that are frequently used in practice to describe the degree of linear association between the dependent (Y) and independent (X) variables. Define these two measures and discuss the relationship between these two measures.
- 4.2 An educator wants to see how the number of absences a student in her class has affected the student's final grade. The data obtained from a sample follow.

No. of absences	10	12	2	1	8	5
Final Mark	70	65	96	94	75	82

- a. Fit the regression line, $Y_i = \beta_0 + \beta_1 X_i$.
- b. Interpret the estimated values of β_0 and β_1 .
- c. Construct a 99% confidence interval for β_1 .
- d. Compute the coefficient of determination and interpret the value.

QUESTION FIVE.

[8 + 4 + 1 + 2 + 1 + 1 + 8 marks]

- 5.1 State the Factor Effects Model for two-factor studies with equal sample sizes and its important features.
- 5.2 A company wishes to test the effectiveness of its advertising. A product is selected, and two types of ads are written; one is serious and one is humorous. Also the ads run on both medium of advertising; television and radio. Sixteen potential customers are selected and assigned randomly to one of the four groups. After seeing or listening to the ad, each customer is asked to rate its effectiveness on a scale of 1 to 20 and the data was analyzed using SPSS. The following ANOVA table is a part of the output from that analysis:

ANOVA TABLE

Source of Variation	Sum of Squares	df	Mean Square	F
Between treatments	186.189			
Factor A	10.563			
Factor B	175.563			
A X B	0.063			
Within treatments	66.250			
Total	252.439			

- Complete the ANOVA Table
- The size of the sample used in this experiment?
- What are the treatments in this experiment?
- Which one is the Factor A?
- Which one is the Factor B?
- Using 5% level of significance, describe only the conclusions (based on F-test) in terms of effectiveness of the types of ad, effectiveness of the medium of advertising and effectiveness of their interaction.

TABLE A.2 (continued) Percentiles of the t DistributionEntry is $t(\lambda; v)$ where $P[t(v) \leq t(\lambda; v)] = \lambda$ 

v	$t(\lambda; v)$						
	.60	.70	.80	.85	.90	.95	.975
1	0.325	0.727	1.376	1.963	3.078	6.314	12.706
