UNIVERSITY OF SWAZILAND

SUPPLEMENTARY EXAMINATION PAPER 2010

TITLE OF PAPER	:	DESIGN AND ANALYSIS OF EXPERIMENTS
COURSE CODE	:	ST404
TIME ALLOWED	:	TWO (2) HOURS
REQUIREMENTS	:	CALCULATOR AND STATISTICAL TABLES
INSTRUCTIONS	:	ATTEMPT ALL QUESTIONS

Question 1 [20 marks, 3+4+3+3+3+4]

(a) Write down a 4×4 Graeco-Latin square.

(b) Suppose that you wish to investigate 3 fertilizer types, by applying them to crops in 3 regions of land. Each region is only large enough for two crops, so that a Balanced Incomplete Block design is called for. Write down an appropriate design. What is λ for your design? Give both the meaning of λ, and its numerical value.

(c) Consider a 2^2 factorial design with factors **A** and **B**, for which the effects model is that the expected value of the k^{th} observation with **A** at level i ($i = 1$ for low, $i = 2$ for high) and **B** at level j ($j = 1$ for low, $j = 2$ for high) is

$$E[y_{ijk}] = \mu + A_i + B_j + (AB)_{ij}.$$

In terms of y_{ijk} and appropriate averages, give expressions for

(i) the estimate of the main effect of the high level **A**,

(ii) the estimate of $(AB)_{ij}$.

(d) An agricultural experiment, to test the effectiveness of certain crop stimulants on certain crops, is carried out as follows. Three 100 hectare plots of land are selected and randomly labelled 1,2,3. In plot 1, wheat is grown. In plot 2, rye is grown and in plot 3, canola is grown. Then each plot is divided into four 25 hectare fields and the four possible stimulants are applied, one to a field, in random order. This entire experiment is then replicated 4 times.

(i) What is the name of the design being used here?

(ii) Viewing replicates as a random factor, **clearly** write down the effects model which you would use to analyze these data. Be sure to describe any constraints on, or distributions of, the terms in your model.

Question 2 [20 marks, 8+8+4]

In an experimental study of the efficacy of treatments for depression, patients attending a clinic were allocated at random to one of a number different drug treatments and other therapies. The response measurement was the decrease in Hamilton Rating Depression Score (HRDS) over a three month course of treatment. The data recorded are tabulated below; entries in the rows of the table are the decrease in HRDS for each treatment. The final group was treated using an inactive treatment (or placebo).

Group					
Therapy 1	5.20	3.65	7.03	5.63	4.57
Therapy 2	7.05	7.91	1.46	4.11	4.18
Drug A	4.71	3.75	2.85	4.89	6.09
Drug B	6.82	6.77	8.31	6.57	6.55
Placebo	5.13	6.07	3.55	5.69	3.97

(a) What kind of design is being used in this study? Identify the *factor* being investigated, and for each factor state the number of levels that that factor has. Is the study *balanced*? Is it *complete*? Justify your answers.

(b) Using the data, an ANOVA analysis is to be carried out. The ANOVA table below contains some missing entries marked by the notation? Write out the ANOVA table in full, filling in the missing values **using the information already given in the table**.

Source	SS	DF	MS	F_0
Group	19.613	?	?	?
Error	?	?	2.295	
Total	?	?		

(c) What is the conclusion of the ANOVA analysis? State clearly the null and alternative hypothesis, the test statistic, the null distribution, and the conclusion.

Question 3 [20 marks, 8+8+4]

The article "Responsiveness of Food Sales to Shelf Space Changes in Supermarkets" (*J. Mktg. Res.* 1969: 63-67) described an experiment to assess the effect of allotted shelf space sales of "Tang". Six stores were used in the experiment, and six different shelf-space allotments of 6, 9, 12, 15, 18 and 21 feet were tried for 1 week. The author speculated that changes in shelf space would affect sales. Data on the number of containers of Tang sold is given in the following table.

	Shelf space (feet)					
Store	6	9	12	15	18	21
1	30	35	25	27	38	31
2	47	59	43	62	65	48
3	47	55	48	54	36	54
4	29	19	41	27	33	39
5	17	11	25	23	24	26
6	22	9	19	18	25	22

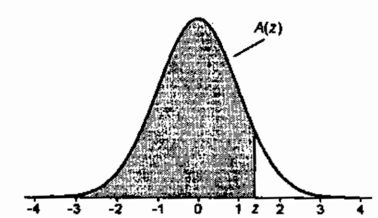
(a) Is there any effect of shelf-space (as a factor) on sales, allowing for different sales in different stores? State clearly your null and alternative hypothesis, decision rule and present you conclusions.

(b) Test for equality of variance by store. State clearly your null and alternative hypothesis, decision rule and present you conclusions.

(c) Compute 95% family-wise confidence intervals for the mean difference in sales between Store 1 and 6. Use the most efficient approach.

TABLE A.1

Cumulative Standardized Normal Distribution



$A(z)$ is the integral of the standardized normal distribution from $-\infty$ to z (in other words, the area under the curve to the left of z). It gives the probability of a normal random variable not being more than z standard deviations above its mean. Values of z of particular importance:

z	$A(z)$	
1.645	0.9500	Lower limit of right 5% tail
1.960	0.9750	Lower limit of right 2.5% tail
2.326	0.9900	Lower limit of right 1% tail
2.576	0.9950	Lower limit of right 0.5% tail
3.090	0.9990	Lower limit of right 0.1% tail
3.291	0.9995	Lower limit of right 0.05% tail

z	0.00	0.01	0.02	0.03	0.04	0.05	0.06	0.07	0.08	0.09

Percentage Points of the t-Distribution

This table gives the percentage points $t_\nu(P)$ for various values of P and degrees of freedom ν, as indicated by the figure to the right.

The lower percentage points are given by symmetry as $-t_\nu(P)$, and the probability that $|t| \geq t_\nu(P)$ is $2P/100$.

The limiting distribution of t as $\nu \to \infty$ is the normal distribution with zero mean and unit variance.

	Percentage points P

Percentage Points of the χ^2-Distribution

This table gives the percentage points $\chi^2_\nu(P)$ for various values of P and degrees of freedom ν, as indicated by the figure to the right.

If X is a variable distributed as χ^2 with ν degrees of freedom, $P/100$ is the probability that $X \geq \chi^2_\nu(P)$.

For $\nu > 100$, $\sqrt{2X}$ is approximately normally distributed with mean $\sqrt{2\nu - 1}$ and unit variance.

5 Percent Points of the F-Distribution

This table gives the percentage points $F_{\nu_1,\nu_2}(P)$ for $P = 0.05$ and degrees of freedom ν_1, ν_2, as indicated by the figure to the right.

The lower percentage points, that is the values $F'_{\nu_1,\nu_2}(P)$ such that the probability that $F \leq F'_{\nu_1,\nu_2}(P)$ is equal to $P/100$, may be found using the formula

$$F'_{\nu_1,\nu_2}(P) = 1/F_{\nu_1,\nu_2}(P)$$

	ν_1

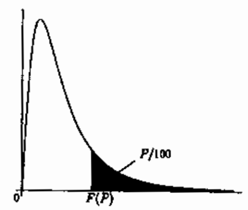
10 Percent Points of the F-Distribution

This table gives the percentage points $F_{\nu_1,\nu_2}(P)$ for $P = 0.10$ and degrees of freedom ν_1, ν_2, as indicated by the figure to the right.

The lower percentage points, that is the values $F'_{\nu_1,\nu_2}(P)$ such that the probability that $F \le F'_{\nu_1,\nu_2}(P)$ is equal to $P/100$, may be found using the formula

$$F'_{\nu_1,\nu_2}(P) = 1/F_{\nu_1,\nu_2}(P)$$



ν_2 \ ν_1	1	2	3	4	5	6	12	24	∞
