

**UNIVERSITY OF SWAZILAND**

**SUPPLEMENTARY EXAMINATION PAPER 2012**

**TITLE OF PAPER : LINEAR STATISTICAL METHODS**  
**COURSE CODE : ST204**  
**TIME ALLOWED : 2 (TWO) HOURS**  
**REQUIRMENTS : STATISTICAL TABLES  
AND CALCULATOR**  
**INSTRUCTIONS : ANSWER ANY 4 (FOUR) QUESTIONS.  
ALL QUESTIONS CARRY EQUAL MARKS.**

**THIS PAPER IS NOT TO BE OPENED UNTIL PERMISSION HAS BEEN  
GRANTED BY THE INVIGILATOR**

**QUESTION ONE.**

[ 4 + 7 + 14 marks ]

- 1.1 State the Simple Linear Regression Model.
- 1.2 Discuss the important features of the Simple Linear Regression Model.
- 1.3 Find the point estimators of  $\beta_0$  and  $\beta_1$  using Method of Least Squares.

**QUESTION TWO.**

[ 8 + 4 + 4 + 4 + 5 marks ]

Consider the following table:

Variable Y	Variable X
12	2
13	2
13	3
14	3
15	4
15	4
14	5
16	5
17	6
18	6

- a. Fit the regression line,  $Y_i = \beta_0 + \beta_1 X_i$ .
- b. Interpret the estimated values of  $\beta_0$  and  $\beta_1$ .
- c. Estimate  $\sigma^2$ .
- d. Construct a 90% confidence interval for  $\beta_1$ .
- e. Test  $\beta_1 = 0$  against  $\beta_1 \neq 0$  at 5% level of significance.

**QUESTION THREE.**

[ 6 + 15 + 4 marks ]

A cereal company wished to test four different package designs for a new breakfast cereal. Ten stores, with approximately equal sales volumes, were selected as the experimental units. Each store was randomly assigned one of the package designs, with two of the package designs assigned to three stores each and the other two designs to two stores each. Sales, in number of cases, were observed for the study period, and the results are recorded in the following table:

Package Design	Store		
	1	2	3
1	12	18	
2	14	12	13
3	19	17	21
4	24	30	

- 3.1 Identify the dependent variable, factor studied and factor levels.
- 3.2 Complete the computation of the ANOVA table and conduct the F test. Clearly state all the steps in the test including the conclusion
- 3.3 Which package design would you prefer? Explain.

**QUESTION THREE.**

[ 5 + 2 + 1 + 1 + 4 + 4 + 4 + 4 marks ]

The castle Bakery Company supplies wrapped Italian bread to a large number of supermarkets in a city. An experimental study was made of the effects of height of the self display (bottom, middle, top) and width of the self display (regular, wide) on sales of this bakery's bread during the experimental period. Twelve supermarkets, similar in terms of sales and clientele, were utilized in the study. The six treatments were assigned at random to two stores and the display of the bread in each store followed the treatment specifications for that store. The sales (number of cases) of the bread were recorded. The data was analyzed using SPSS. The following ANOVA table is a part of the output from that analysis:

**ANOVA TABLE**

Source of Variation	Sum of Squares	df	Mean Square	F
Between treatments	-	-	-	-
Factor A	1544	2	-	-
Factor B	12	1	-	-
A X B	24	-	-	-
Within treatments	62	-	-	-
Total	1642	-	-	-

Answer the following questions:

- a. Complete the ANOVA Table.
- b. What are the treatments in this experiment?
- c. Which one is the Factor A?
- d. Which one is the Factor B?
- e. Use 5% level of significance for the following test: [ provide only the value of the Test Statistic, Table value, Decision and Conclusion ]
  - i. Do the data provide sufficient evidence to indicate a difference in the mean sale for the three display height?
  - ii. Is there evidence to indicate a difference in mean sale for the two display width?
  - iii. Is there any evidence to indicate a significant effect due to interaction between display height and display width?
  - iv. Do the data provide sufficient evidence to indicate a difference in the mean sale for the six treatments?

**QUESTION FIVE.**

[ 2 + 3 + 6 + 7 + 7 marks]

A study is conducted on  $n = 10$  plots that had been fertilized in varying degrees to observed the changes in the yield of corn. The following results were obtained from running the regression model,  $Y_i = \beta_0 + \beta_1 X_i + \varepsilon_i$  using the study data:

**ANOVA**

Model		Sum of Squares	df	Mean Square	F
1	Regression	964.587	1	964.587	1.478
	Residual	5221.413	8	652.677	
	Total	8186.000	9		

**Coefficients**

Model		Unstandardized Coefficients		Standardized Coefficients
		B	Std. Error	Beta
1	Constant	10.115	3.108	
	x	2.784	1.926	.602

- 5.1 Identify the dependent variable and independent variable.
- 5.2 State the fitted regression line.
- 5.3 Perform the F-test and clearly state the hypotheses and conclusion.
- 5.4 Test  $\beta_0 = 10$  against  $\beta_0 \neq 10$  at  $\alpha = 0.05$ .
- 5.5 Test  $\beta_1 = 3$  against  $\beta_1 > 3$  at  $\alpha = 0.01$ .

TABLE A.2 Percentiles of the *t* Distribution

Entry is  $t(A; \nu)$  where  $P\{t(\nu) \leq t(A; \nu)\} = A$
