

DEPARTMENT OF STATISTICS AND DEMOGRAPHY

SUPPLEMENTARY EXAMINATION, 2014/15

COURSE TITLE: DESIGN AND ANALYSIS OF EXPERIMENTS

COURSE CODE: ST 404

TIME ALLOWED: TWO (2) HOURS

INSTRUCTION: 1. ANSWER ANY FOUR QUESTIONS;
2. EACH QUESTION CARRIES 25 MARKS.

SPECIAL REQUIREMENTS: SCIENTIFIC CALCULATORS AND GRAPH PAPER

DO NOT OPEN THIS PAGE UNTIL PERMISSION HAS BEEN GRANTED BY THE CHIEF INVIGILATOR

Question 1

Three varieties of potatoes are being compared for yield. An experiment was conducted using 9 uniform plots at each of the 4 different locations. Each variety of potato was planted at each location on 3 plots selected at random. The yields in kg/plot were as follows:

Location	Variety		
	A	B	C
1	15	20	22
	19	24	17
	12	18	14
2	17	29	26
	10	18	19
	13	22	21
3	9	12	10
	12	15	5
	6	10	8
4	14	21	19
	8	16	15
	11	12	12

Use 0.05 level of significance to test the hypotheses that:

- (a) There is no difference in the yielding capacities of the 3 varieties of potatoes. (8 marks)
- (b) Different locations have no effect on the yields. (7 marks)
- (b) The locations and varieties of potatoes do not interact. (10 marks)

Question 2

A study was undertaken to investigate the water holding capacity of the soil in three different areas of Woodlands. In each area, a number of soil samples were collected randomly and sent to the same laboratory for analysis. The following table gives the water holding capacity (in milliliter per gram) of soil samples collected in each area.

Woodland A:	72	51	38	87	77	65	70	66	64	74
Woodlands B:	35	33	29	50	44	17	47	58		
Woodlands C:	54	62	88	65	80	53				

- (a) State and explain a linear model, which can be used for a one-way analysis of variance. Explain clearly what each term in the model represents and state any assumptions required for the analysis to be valid. (10 marks)
- (b) Carry out a suitable analysis of the data, stating the assumptions you have made and explaining what you conclude as a result of your analysis. (15 marks)

Question 3**Page 3 of 4**

The following table presents scores of 9 college students of different ethnic backgrounds and professional interests who did a Mature Entry Aptitude test for admission to the University of Swaziland.

Programme	Swazi	South African	Zimbabwean
Agriculture	A (75)	B (86)	C (69)
Law	B (95)	C (79)	A (86)
Engineering	C (70)	A (83)	B (93)

The letter A, B, and C indicate venues in which the 9 students wrote. Analyse the data using $\alpha=0.05$ and test the hypotheses that:

- (a) Writing in different venues has no effect on the scores of students. **(9 marks)**
- (b) Different ethnic background has no effect on the scores. **(8 marks)**
- (c) Differences in professional interests have no effect on the scores. **(8 marks)**

Question 4

- (a) The effects of baking temperature on the crustiness of bread are contained in Table 1. The data are scores from 1 to 20.

Temperature					
Low		Medium		High	
Batch 1	Batch 2	Batch 1	Batch 2	Batch 1	Batch 2
4	12	14	9	14	16
7	8	13	10	17	19
5	10	11	12	15	18

Use an ANOVA to test for temperature effects; use $\alpha = 0.05$. State the alternatives, decision rule and conclusion. **(12 marks)**

- (b) An experiment involving the case hardening of lightweight shafts machined from alloys bars of an alloy was run to study the effects of the amount of a chemical agent added to the alloy in a molten state (factor A), the temperature of the hardening process (factor B), and the time duration of the hardening process (factor C) on the outside hardness shaft. All factors were at 2 levels(1: low, 2:high), and the number of rods tested for each treatment was $n = 3$. The data on hardness (in Brinell units) follow:

k = 1		k = 2	
j = 1	j = 2	j = 1	j = 2
i = 1	39.9	53.5	56.0
	32.3	50.7	56.9
	36.3	52.8	56.6
i = 2	45.2	63.3	69.4
	48.0	65.5	66.6
	47.5	63.6	68.8

Test for three-factor interactions; use $\alpha = 0.05$. State the alternatives, decision rule, and conclusions. **(13 marks)**

- (a) Divide the treatment combinations of a 2^4 factorial experiment into four blocks by confounding ABC and ABD. What additional effect is also confounded with blocks? **(12 marks)**
- (b) Consider a 2^5 experiment where the experimental runs are on 4 different machines. Use the machines as blocks, and assume that all main effects and two-factor interactions may be important.
- (i) Which runs would be made on each of the 4 machines? **(8 marks)**
 - (ii) Which effects are confounded with blocks? **(5 marks)**

END OF EXAM!!

III. Percentage Points of the χ^2 Distribution*
